

Elements® Headwall System

Developed with a network of health care professionals to ensure best practices.

The WittRock HC® ELEMENTS® System serves the needs of architects, clinicians, contractors and patients by providing an attractive, flexible, plug-n-play system for the patient's room. Elements component system optimizes caregiver efficiency and safely manages bedside technology. A hospitality-inspired design, ELEMENTS headwall sets a new industry standard for creating acuity adaptable patient-care environments.

- Removable panel system and a unique gas manifold that makes it simple to add medical gases, in addition to easy data and electrical services upgrades.
- Pre-plumbed and pre-wired frames offer single-point connections for fast and simple installation.
- The industries most extensive offering of installation ready casework and workflow modules.

Achieve flexibility

The hospital of the future must support patients with higher acuity that are migrating into lower acuity patient environments. This requires patient rooms that can “flex up”, to be acuity adaptable in a matter of hours with less disruption to patient care. The ELEMENTS headwall system is designed with upgradable medical gas, electrical and data systems that allow patient rooms to efficiently transform from Med-Surg to ICU.

Award-winning design

ELEMENTS headwall, the winner of the Nightingale Award, provides architects and designers with an artist's palette of materials, finishes and design options to create a unique signature look. Health care designers can plan with a “building block” component system of frames, panels, cabinets and workflow modules that can be configured and scaled for every project design, budget and functional requirement.

Invest in Technology

ELEMENTS® headwall “plug-n-play” technology offers upgradable features such as gas manifolds, accessory rails for medical devices, and provisions for data and information systems. A pre-wired, pre-plumbed framework with leveling and aligning features installs directly onto a conventional stud wall or can be constructed as part of a partition wall with single-point connections for gases and electricals. Life-cycle durability and sustainability provide a significant return on investment.

Independently **tested** for recommended **sound ratings**

To help hospitals manage sound levels for patient comfort and privacy, the ELEMENTS® System is the first headwall product line to **independently test for ASTM sound transmission standards**.

Ergonomic workflow

The ELEMENTS System seeks to improve workflow efficiency and ergonomics by organizing frequently used bedside utilities and devices into an easy to reach zone that minimizes bending and reaching.
